

## How much fear does Covid-19 have left?

At its peak Covid-19 became a force that radically altered the social and economic landscape of the world as its death toll continued its seemingly endless upward trajectory. This skyrocketed death toll subsequently led to an appropriate rise in fear and concern over two main factors: the **state of the economy** and the potential of **getting infected**. Using polled survey data, quite a bit of interesting observations can be made regarding when concern over these variables peaked and just how severe the concern level was.

We can ascertain that concern levels peaked for the **economy** on **March 29, 2020** and they peaked for getting **infected** on **January 30, 2021**. Over time, however, ‘very concerned’ levels **decreased** and ‘not at all concerned’ and ‘not very concerned’ levels started to **increase** - especially over concern about getting **infected**. Key to note is that while concern levels have decreased, they have *not* completely dissipated. There are still people who have

subtle, lingering concerns regarding both getting infected and the economy.
